REVISION HISTORY

| Issue Date | Revisions | Revised By | | | |
|------------------|--|---|--|--|--|
| 30 April 2015 | Initial Issue | | | | |
| 29 February 2016 | The following amendments are made in the report: 1. FCC ID of the sleeve is added 2. In Section 1 and 6.1., DUT description is updated 3. In Section 2,KDB list is updated to include latest KDB versions 4. In Section 2, typo in Test specification – purpose of test is amended 5. In Section 5, note added under the uncertainty budget tables 6. In Section 6.3., the date of the original report is added 7. In Section 7, the date of the original report is added 8. In Sections 10.2. and 10.3., host test separation distance note is added 9. In Sections 12.3. and 12.4., the FCC ID of the sleeve is added 10. Section 12.8 'Baseline Plots' added | Sandhya Menon | | | |
| 09 March 2016 | The following amendments are made in the report: 1. Updated the EUT name in the front sheet. 2. Updated the simultaneous transmission results on section 1 3. Updated the EUT description in section 6.1 4. Updated Tune up power in section 10.4 5. Updated the simultaneous transmission sum in section 11 | Naseer Mirza | | | |
| | 30 April 2015 29 February 2016 | The following amendments are made in the report: 1. FCC ID of the sleeve is added 2. In Section 1 and 6.1., DUT description is updated 3. | Test Results | Pass | | | | | |

UL VS Ltd. tested the above equipment in accordance with the requirements set forth in the above standards. All indications of Pass/Fail in this report are opinions expressed by UL VS Ltd. based on interpretations and/or observations of test results. Measurement Uncertainties are in accordance with the above standard and are published for informational purposes only. The test results show that the equipment tested is capable of demonstrating compliance with the requirements as documented in this report.

Note: The results documented in this report apply only to the tested sample(s), under the conditions and modes of operation as described herein. This document may not be altered or revised in any way unless done so by UL VS Ltd. and all revisions are duly noted in the revisions section. Any alteration of this document not carried out by UL VS Ltd. will constitute fraud and shall nullify the document. This report must not be used by the client to claim product certification, approval, or endorsement by UKAS. This report is written to support regulatory compliance of the applicable standards stated above.

2. Test Specification, Methods and Procedures

2.1. Test Specification

| Reference: | KDB 865664 D01 SAR Measurement 100 MHz to 6 GHz v01r04 |
|------------------|---|
| Title: | SAR Measurement Requirements for 100 MHz to 6 GHz |
| Purpose of Test: | Field probes, tissue dielectric properties, SAR scans, measurement accuracy and variability of the measured results are discussed. The field probe and SAR scan requirements are derived from criteria considered in IEEE 1528: 2013. |

The Equipment Under Test complied with the Specific Absorption Rate for general population/uncontrolled exposure limit of 1.6 W/kg as specified in FCC 47 CFR part 2 (2.1093) and ANSI C95.1-1992 and has been tested in accordance with the reference documents in section 2.2 of this report.

2.2. Methods and Procedures Reference Documentation

The methods and procedures used were as detailed in:

IEEE 1528: 2013

IEEE Recommended Practice for Determining the Peak Spatial-Average Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques

Thomas Schmid, Oliver Egger and Neils Kuster, "Automated E-field scanning system for dosimetric assessments", IEEE Transaction on microwave theory and techniques, Vol. 44, pp. 105-113, January 1996.

2.3. Definition of Measurement Equipment

The measurement equipment used complied with the requirements of the standards referenced in the methods & procedures section above. Appendix 1 contains a list of the test equipment used.

UL VS Ltd, is accredited by UKAS (United Kingdom Accreditation Service), Laboratory UKAS Code 0644.

UL VS Ltd. Report No.: 3.0

4. SAR Measurement System & Test Equipment

4.1. SAR Measurement System

The DASY system used for performing compliance tests consists of the following items:

Issue Date: 09 March 2016

- A standard high precision 6-axis robot with controller, teach pendant and software. An arm extension for accommodating the data acquisition electronics (DAE).
- An isotropic Field probe optimized and calibrated for the targeted measurement.
- A data acquisition electronics (DAE) which performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. The unit is battery powered with standard or rechargeable batteries. The signal is optically transmitted to the EOC.
- The Electro-optical converter (EOC) performs the conversion from optical to electrical signals for the digital communication to the DAE. To use optical surface detection, a special version of the EOC is required. The EOC signal is transmitted to the measurement server.
- The function of the measurement server is to perform the time critical tasks such as signal filtering, control of the robot operation and fast movement interrupts.
- The Light Beam used is for probe alignment. This improves the (absolute) accuracy of the probe positioning.
- A computer running WinXP or Win7 and the DASY software.
- Remote control and teach pendant as well as additional circuitry for robot safety such as warning lamps, etc.
- The phantom, the device holder and other accessories according to the targeted measurement.

Page 8 of 192

4.2. Test Equipment

The measuring equipment used to perform the tests documented in this report has been calibrated in accordance with the manufacturers' recommendations, and is traceable to recognized national standards.

4.4. SAR Measurement Procedure

4.4.1. Normal SAR Measurement Procedure

Step 1: Power Reference Measurement

The Power Reference Measurement and Power Drift Measurements are for monitoring the power drift of the device under test in the batch process. The minimum distance of probe sensors to surface determines the closest measurement point to phantom surface. The minimum distance of probe sensors to surface is 2.1 mm. This distance cannot be smaller than the distance of sensor calibration points to probe tip as defined in the probe properties

Step 2: Area Scan

The Area Scan is used as a fast scan in two dimensions to find the area of high field values, before doing a fine measurement around the hot spot. The sophisticated interpolation routines implemented in DASY software can find the maximum locations even in relatively coarse grids. When an Area Scan has measured all reachable points, it computes the field maximal found in the scanned area, within a range of the global maximum. The range (in dB) is specified in the standards for compliance testing. For example, a 2 dB range is required in IEEE Standard 1528 and IEC 62209-1 / IEC 62209-2 standards. If only one Zoom Scan follows the Area Scan, then only the absolute maximum will be taken as reference. For cases where multiple maximums are detected, the number of Zoom Scans has to be increased accordingly.

Area Scan Parameters extracted from KDB 865664 D01 SAR Measurement 100 MHz to 6 GHz

| | ≤3 GHz | > 3 GHz |
|--|--|--|
| Maximum distance from closest measurement point (geometric center of probe sensors) to phantom surface | 5 ± 1 mm | $\frac{1}{2} \cdot \delta \cdot \ln(2) \pm 0.5 \text{ mm}$ |
| Maximum probe angle from probe axis to phantom surface normal at the measurement location | 30° ± 1° | 20° ± 1° |
| | \leq 2 GHz: \leq 15 mm 2 – 3 GHz: \leq 12 mm | 3 – 4 GHz: ≤ 12 mm 4 – 6 GHz: ≤ 10 mm |
| Maximum area scan spatial resolution: Δx_{Area} , Δy_{Area} | When the x or y dimension of the test device, in the measurement plane orientation, is smaller than the above, the measurement resolution must be \leq the corresponding x or y dimension of the test device with at least one measurement point on the test device. | |

Step 3: Zoom Scan

Zoom Scans are used to assess the peak spatial SAR values within a cubic averaging volume containing 1 g and 10 g of simulated tissue. The Zoom Scan measures points (refer to table below) within a cube whose base faces are centered on the maxima found in a preceding area scan job within the same procedure. When the measurement is done, the Zoom Scan evaluates the averaged SAR for 1 g and 10 g and displays these values next to the job's label.

Zoom Scan Parameters extracted from KDB 865664 D01 SAR Measurement 100 MHz to 6 GHz

| | | | ≤3 GHz | > 3 GHz |
|--|---|---|--|--|
| Maximum zoom scan s | mum zoom scan spatial resolution: Δx_{Zoom} , Δy_{Zoom} | | \leq 2 GHz: \leq 8 mm 2 – 3 GHz: \leq 5 mm [*] | 3 – 4 GHz: ≤ 5 mm* 4 – 6 GHz: ≤ 4 mm* |
| | uniform grid: $\Delta z_{Z_{00m}}(n)$ | | ≤ 5 mm | 3 – 4 GHz: ≤ 4 mm 4 – 5 GHz: ≤ 3 mm 5 – 6 GHz: ≤ 2 mm |
| Maximum zoom scan spatial resolution, normal to phantom surface | graded | Δz _{Zoom} (1): between 1 st two points closest to phantom surface | ≤ 4 mm | 3 – 4 GHz: ≤ 3 mm 4 – 5 GHz: ≤ 2.5 mm 5 – 6 GHz: ≤ 2 mm |
| | grid $\Delta z_{Zoom}(n>1)$: between subsequent points | | ≤1.5·Δz | z _{zoom} (n-1) |
| Minimum zoom scan volume | x, y, z | | ≥ 30 mm | 3 – 4 GHz: ≥ 28 mm 4 – 5 GHz: ≥ 25 mm 5 – 6 GHz: ≥ 22 mm |

Note: δ is the penetration depth of a plane-wave at normal incidence to the tissue medium; see draft standard IEEE P1528-2011 for details.

Step 4: Power drift measurement

The Power Drift Measurement measures the field at the same location as the most recent power reference measurement within the same procedure, and with the same settings. The Power Drift Measurement gives the field difference in dB from the reading conducted within the last Power Reference Measurement. This allows a user to monitor the power drift of the device under test within a batch process. The measurement procedure is the same as Step 1.

Step 5: Z-Scan (FCC only)

The Z Scan measures points along a vertical straight line. The line runs along the Z-axis of a one-dimensional grid. In order to get a reasonable extrapolation the extrapolated distance should not be larger than the step size in Z- direction.

When zoom scan is required and the <u>reported</u> SAR from the area scan based *1-g SAR estimation* procedures of KDB 447498 is ≤ 1.4 W/kg, ≤ 8 mm, ≤ 7 mm and ≤ 5 mm zoom scan resolution may be applied, respectively, for 2 GHz to 3 GHz, 3 GHz to 4 GHz and 4 GHz to 6 GHz.

4.5. Volumetric Scan Procedure

Step 1: Repeat Step 1-4 in Section 4.3

Step 2: Volume Scan

Volume Scans are used to assess peak SAR and averaged SAR measurements in largely extended 3-dimensional volumes within any phantom. This measurement does not need any previous area scan. The grid can be anchored to a user specific point or to the current probe location.

Step 3: Power drift measurement

The Power Drift Measurement measures the field at the same location as the most recent power reference measurement within the same procedure, and with the same settings. The Power Drift Measurement gives the field difference in dB from the reading conducted within the last Power Reference Measurement. This allows a user to monitor the power drift of the device under test within a batch process. The measurement procedure is the same as Step 1.

Page 15 of 192
UL VS Ltd. Report No.: 3.0

5. Measurement Uncertainty

No measurement or test can ever be perfect and the imperfections give rise to error of measurement in the results. Consequently, the result of a measurement is only an approximation to the value of the measurand (the specific quantity subject to measurement) and is only complete when accompanied by a statement of the uncertainty of the approximation.

The expression of uncertainty of a measurement result allows realistic comparison of results with reference values and limits given in specifications and standards.

The uncertainty of the result may need to be taken into account when interpreting the measurement results.

The reported expanded uncertainties below are based on a standard uncertainty multiplied by an appropriate coverage factor, such that a confidence level of approximately 95% is maintained. For the purposes of this document "approximately" is interpreted as meaning "effectively" or "for most practical purposes".

| Test Name | Confidence Level | Calculated Uncertainty |
|---|---------------------|---------------------------|
| Uncertainty- GSM 850 / WCDMA FDD 5 / CDMA BC 0 / CDMA BC 10 / LTE Band 5 / LTE Band 13 / LTE Band 17 Head Configuration 1g | 95% | ±18.77% |
| Uncertainty- GSM / GPRS / EDGE 850 / WCDMA FDD 5 / CDMA BC 0 / CDMA BC 10 / LTE Band 5 / LTE Band 13 / LTE Band 17 Body Configurations 1g | 95% | ±18.36% |
| Uncertainty- WCDMA FDD 4 / LTE Band 4 Head Configuration 1g | 95% | ±18.45% |
| Uncertainty- WCDMA FDD 4 / LTE Band 4 Body Configuration 1g | 95% | ±18.45% |
| Uncertainty- PCS 1900 / WCDMA FDD 2/ CDMA BC 0 / LTE Band 2 / LTE Band 25 Head Configuration 1g | 95% | ±18.88% |
| Uncertainty- PCS / GPRS / EDGE 1900 / WCDMA FDD 2 / CDMA BC 0 / LTE Band 2 / LTE Band 25 Body Configuration 1g | 95% | ±18.26% |
| Uncertainty- Wi-Fi 2450 MHz Head Configuration 1g | 95% | ±18.13% |
| Uncertainty- Wi-Fi 2450 MHz Body Configuration 1g | 95% | ±18.35% |
| Uncertainty- Wi-Fi 5GHz Head Configuration 1g | 95% | ±21.25% |
| Uncertainty- Wi-Fi 5GHz Body Configuration 1g | 95% | ±19.90% |

The methods used to calculate the above uncertainties are in line with those recommended within the various measurement specifications. Where measurement specifications do not include guidelines for the evaluation of measurement uncertainty, the published guidance of the appropriate accreditation body is followed.

Note: The calculated uncertainty depicted in the table above and shown in the following tables is indicative of the worst case amongst the bands listed.

6. Device Under Test (DUT) Information

6.1. DUT Description

Phone Cover (Sleeve)

| 1 110110 00101 (01 | |
|--------------------------|---|
| DUT Description: | The InfineaX is a small handheld barcode reader with RFID and Bluetooth. This terminal is designed to operate with an iPhone 5, iPhone 5S, iPod touch 5th generation and iPod 6th generation. |
| Model Number: | Linea MED iPhone |
| Serial Number: | MAR003421UN14 |
| Hardware Version Number: | None Stated |
| Software Version Number: | None Stated |
| Country of Manufacture: | Bulgaria |
| Date of Receipt: | 26 March 2015 |
| EUT Dimensions: | 148mm (L) x 72mm (W) x 31mm (H) |

6.3. Nominal and Maximum Output Power

Host Device

All nominal and maximum output power measurements are as documented in the original FCC SAR reports 11U14136-7A1 and 12U14759-2C issued on 6th Sept 2012.

Page 29 of 192

7. RF Exposure Conditions (Test Configurations)

Standalone measurements are performed on the host device and compared to the original grant reported levels for all bands on the indicated worst case position in the original SAR report for the host device.

As per the interim sleeve procedure, the highest SAR configuration among the different wireless modes in each frequency band and any SAR configuration in the original report > 75% of the SAR limit; should be measured separately for head, body-worn accessories and hotspot modes when applicable on the host device. When the measured SAR values of the highest SAR configurations are identical (before rounding up), select the configuration with the highest maximum output power. The SAR results should be each scaled with respect to the power level tested by to determine compliance.

After completing the Standalone measurements on the host device, the runs are repeated using the phone cover attached. Section 10 contains the SAR test results obtained with and without the phone cover attached along with the deviation in results with respect to the original FCC SAR reports 11U14136-7A1 and 12U14759-2C issued on 6th Sept 2012.

9. Dielectric Property Measurements & System Check

9.1. Tissue Dielectric Parameters

The temperature of the tissue-equivalent medium used during measurement must also be within 18°C to 25°C and within ± 2°C of the temperature when the tissue parameters are characterized.

The dielectric parameters must be measured before the tissue-equivalent medium is used in a series of SAR measurements. The parameters should be re-measured after each 3-4 days of use; or earlier if the dielectric parameters can become out of tolerance; for example, when the parameters are marginal at the beginning of the measurement series.

Tissue dielectric parameters were measured at the low, middle and high frequency of each operating frequency range of the test device.

NOTE: For convenience, permittivity and conductivity values at some frequencies that are not part of the original data from Drossos et al. [B60] or the extension to 5800 MHz are provided (i.e., the values shown in italics). These values were linearly interpolated between the values in this table that are immediately above and below these values, except the values at 6000 MHz that were linearly extrapolated from the values at 3000 MHz and 5800 MHz.

9.2. System Check

SAR system verification is required to confirm measurement accuracy, according to the tissue dielectric media, probe calibration points and other system operating parameters required for measuring the SAR of a test device. The system verification must be performed for each frequency band and within the valid range of each probe calibration point required for testing the device. The same SAR probe(s) and tissue-equivalent media combinations used with each specific SAR system for system verification must be used for device testing. When multiple probe calibration points are required to cover substantially large transmission bands, independent system verifications are required for each probe calibration point. A system verification must be performed before each series of SAR measurements using the same probe calibration point and tissueequivalent medium. Additional system verification should be considered according to the conditions of the tissue-equivalent medium and measured tissue dielectric parameters, typically every three to four days when the liquid parameters are re-measured or sooner when marginal liquid parameters are used at the beginning of a series of measurements.

9.3. Reference Target SAR Values

The reference SAR values are obtained from the calibration certificate of system validation dipoles. The measured values are normalised to 1 Watt.

9.4. Dielectric Property Measurements & System Check Results

The 1-g SAR and 10-g SAR measured with a reference dipole, using the required tissue-equivalent medium at the test frequency, must be within 10% of the manufacturer calibrated dipole SAR target. The internal limit is set to 5%.

10. Measurements, Examinations and Derived Results

10.1. General Comments

This section contains test results only.

Measurement uncertainties are evaluated in accordance with current best practice. Our reported expanded uncertainties are based on standard uncertainties, which are multiplied by an appropriate coverage factor to provide a statistical confidence level of approximately 95%. Please refer to section 8 for details of measurement uncertainties.

Note(s):

Page 43 of 192

^{*} Body worn & Hotspot in the original report were performed at 10mm.

^{*} Scaled 1g SAR Reported is calculated based on the following KDB inquiry response:

^{1.} When the <u>reported</u> SAR of the test sample measured without accessory (sleeve) attached is equal to or higher than the <u>reported</u> SAR of the same test configuration in the original equipment certification filing, used the <u>reported</u> SAR of the test sample with accessory (sleeve) attached as the SAR result for the test configuration.

^{2.} When the <u>reported</u> SAR of the test sample measured without accessory (sleeve) attached is lower than the <u>reported</u> SAR of the same test configuration in the original equipment certification filing, adjust the <u>reported</u> SAR of the test sample with accessory (sleeve) attached by the ratio of <u>reported</u> SAR in the original filing to the <u>reported</u> SAR of the test sample without the accessory (sleeve) attached as the SAR result for the test configuration.

^{3.} An alternative proposal to test *Bluetooth* was submitted and approved by the FCC under the scenario since, the host manufacturer was unable to provide the necessary tools to drive the host device into *Bluetooth* test mode. The proposal to use Wi-Fi antenna to simulate BT transmission at the appropriate power level was used in light of the shared frequencies. All SAR measurements/calculations showing the host+sleeve complying with standalone and simultaneous transmissions (as outlined in the TCB sleeve guidance) were submitted to this inquiry prior to authorization.

10.3. Specific Absorption Rate - Test Results - A1429

Note(s):

Page 45 of 192

^{*} Body worn & Hotspot in the original report were performed at 10mm.

^{*} Scaled 1g SAR Reported is calculated based on the following KDB inquiry response:

^{1.} When the <u>reported</u> SAR of the test sample measured without accessory (sleeve) attached is equal to or higher than the <u>reported</u> SAR of the same test configuration in the original equipment certification filing, used the <u>reported</u> SAR of the test sample with accessory (sleeve) attached as the SAR result for the test configuration.

^{2.} When the <u>reported</u> SAR of the test sample measured without accessory (sleeve) attached is lower than the <u>reported</u> SAR of the same test configuration in the original equipment certification filing, adjust the <u>reported</u> SAR of the test sample **with accessory** (sleeve) attached by the ratio of <u>reported</u> SAR in the original filing to the <u>reported</u> SAR of the test sample **without the accessory** (sleeve) attached as the SAR result for the test configuration.

^{3.} An alternative proposal to test *Bluetooth* was submitted and approved by the FCC under the scenario since, the host manufacturer was unable to provide the necessary tools to drive the host device into *Bluetooth* test mode. The proposal to use Wi-Fi antenna to simulate BT transmission at the appropriate power level was used in light of the shared frequencies. All SAR measurements/calculations showing the host+sleeve complying with standalone and simultaneous transmissions (as outlined in the TCB sleeve guidance) were submitted to this inquiry prior to authorization.

10.4. Bluetooth (Sleeve)

10.4.1. Standalone SAR Test Exclusion Considerations

The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances ≤ 50 mm are determined by:

[(max. power of channel, including tune-up tolerance, mW) / (min. test separation distance, mm)]·[$\sqrt{f(GHz)}$] \leq 3.0, for 1-g SAR and \leq 7.5 for 10-g extremity SAR, where

- f_(GHz) is the RF channel transmit frequency in GHz
- Power and distance are rounded to the nearest mW and mm before calculation
- The result is rounded to one decimal place for comparison

The test exclusions are applicable only when the minimum test separation distance is \leq 50 mm and for transmission frequencies between 100 MHz and 6 GHz. When the minimum test separation distance is < 5 mm, a distance of 5 mm is applied to determine SAR test exclusion.

Body-worn Accessory Exposure Conditions

| Max. tune-up tolerance limit | | Min. test separation distance (mm) | Frequency (GHz) | Result | |
|---------------------------------|-------|---------------------------------------|--------------------|---------|--|
| (dBm) | (mW) | alotairos (iriiri) | (3: 1-) | | |
| -30.0 | 0.001 | 10 | 2.40 | 0.00002 | |

Conclusion:

The computed value is < 3; therefore, Bluetooth qualifies for Standalone SAR test exclusion.

10.4.2. Estimated SAR

When the standalone SAR test exclusion is applied to an antenna that transmits simultaneously with other antennas, the standalone SAR must be estimated according to following to determine simultaneous transmission SAR test exclusion:

(max. power of channel, including tune-up tolerance, mW) / (min. test separation distance, mm)]·[√f(GHz)/x] W/kg for test separation distances ≤ 50 mm;

where x = 7.5 for 1-g SAR, and x = 18.75 for 10-g SAR.

0.4 W/kg for 1-g SAR and 1.0 W/kg for 10-g SAR, when the test separation distances is > 50 mm.

Estimated SAR Result for Body-worn Accessory Conditions:

| Test | I tolerance limit | | Frequency | Estimated | |
|---------------|-------------------|----|-----------|---------------------------------|--|
| Configuration | | | (GHz) | 1-g SAR (W/kg) | |
| Back/Front | 0.001 | 10 | 2.4 | 0.00002 (Rounded to ~ 0.001) | |

11. Simultaneous Transmission Analysis

According to the worst case configuration Simultaneous transmission analysis of worst cases is shown in the tables below.

Overall Worst Case:

- 1. WWAN + WLAN 2.4 GHz
- 2. WWAN + WLAN 5.0 GHz
- 3. WWAN + WPAN
- 4. WPAN + WLAN 5.0 GHz
- 5. WWAN + WLAN 5.0 GHz + WPAN
